

Plugin GoogleMaps (P)

This extension is a plugin for displaying one or more Google Maps within articles, modules, or components for Joomla!.

As with a lot of plugins, the map is displayed by using a special tag containing numerous parameters. These offer the ability to really customize your map contents and the following is a small selection of this plugin's features:

- Adjustable width and height
- Adjustable latitude and longitude
- Zoom controls
- Map markers
- Add selections and tooltips to your map

The GoogleMaps Plugin is installed via the Extension Manager with default configurations set in the plugin, with the ability to override with each instance of using the plugin trigger tag.

A GoogleMaps reference key is required to use most Google Map services and is a requirement for this plugin to work.
